Distance Judgements Improve over Days of Training without Feedback

Last session of multi-day training

Shinn-Cunningham (2000)

Kopčo et al. (2004a)

When Cues Become Unreliable

- Schoolmaster et al. (2004), Kopčo et al. (2004b)
 - **Distance Localization Task** in Virtual Acoustics
 - **Room Acoustics** was either **FIXED** or **MIXED** on trial-by-trial basis (roved)
 - Distance Localization was **BETTER in FIXED than in MIXED**
 - **Learning** was **impaired by MIXED** but not FIXED
- Kopčo et al. (2012)
 - Distance Discrimination Task
 - **Sound Level Cue** was **ROVED** (randomized) on trial-by-trial basis
 - Distance Localization is Possible with ROVED level

Hypotheses

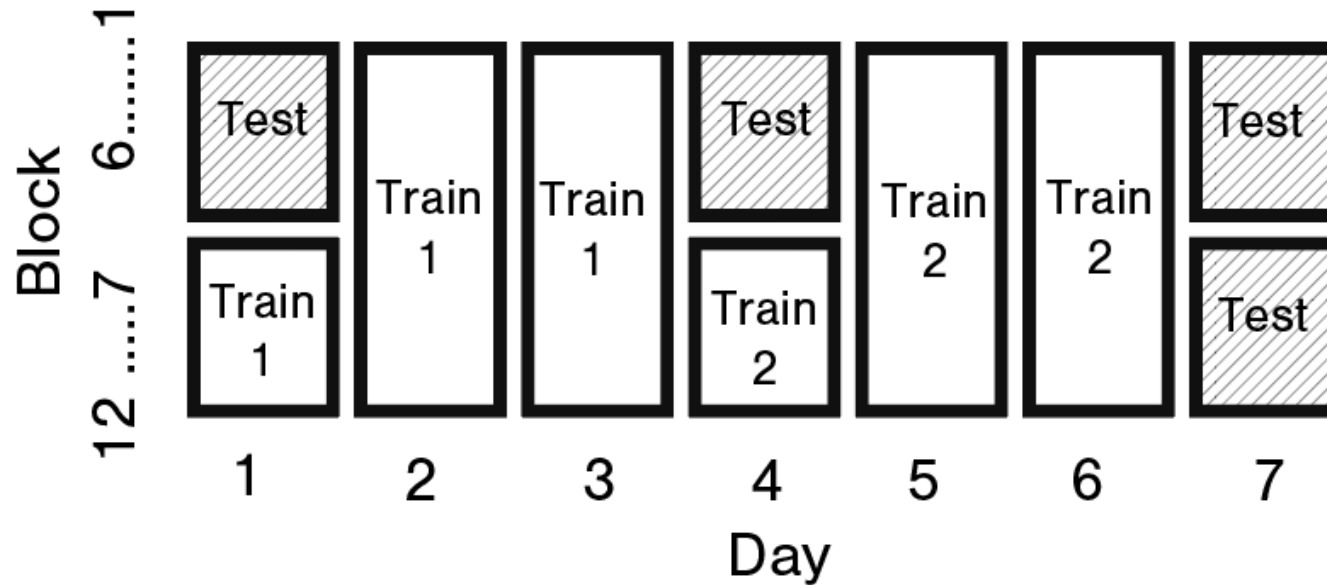

H1: People **improve spontaneously** in **distance localization task** over **multiple days**.

H2: Inconsistent (**roved**) level cues **impair initial performance** but **help learning** of distance mappings.

H3: Memory consolidation is necessary for learning of distance mappings.

Approach

- **Distance localization task without feedback** over 7 days
- Two types of blocks of 64 trials:
 - F – level is Fixed
 - R – level is Roved on trial-by-trial basis
- 300 ms broadband noise, visual pointer
- 0.69 m – 2.04 m
- 4 groups per 8 people
- Spearman's Rank Coefficient

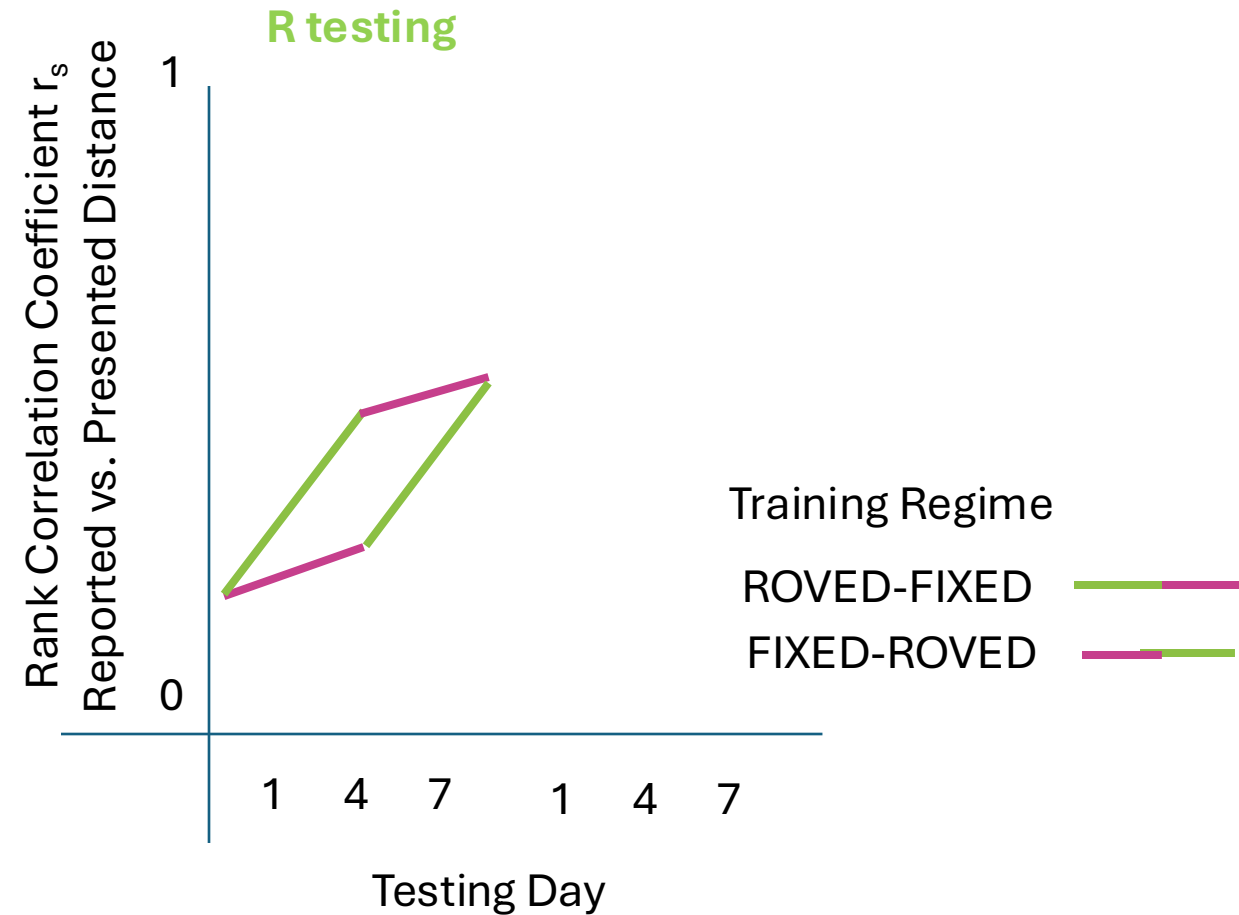

Testing (Finit, Rinit) - Training Block Structure

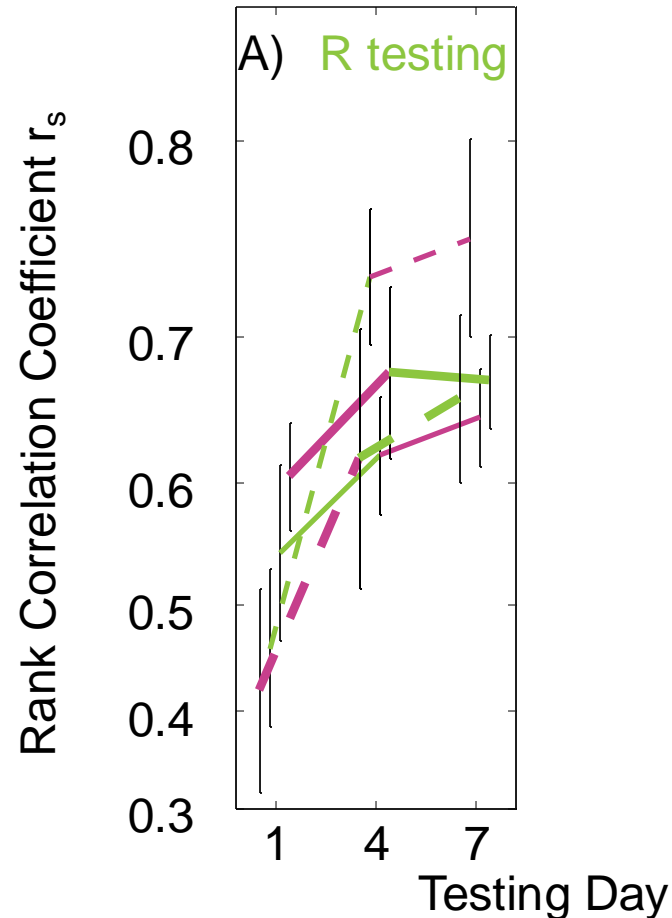

Predictions

Testing: Blocks 1-6 of Testing Days 1, 4, 7

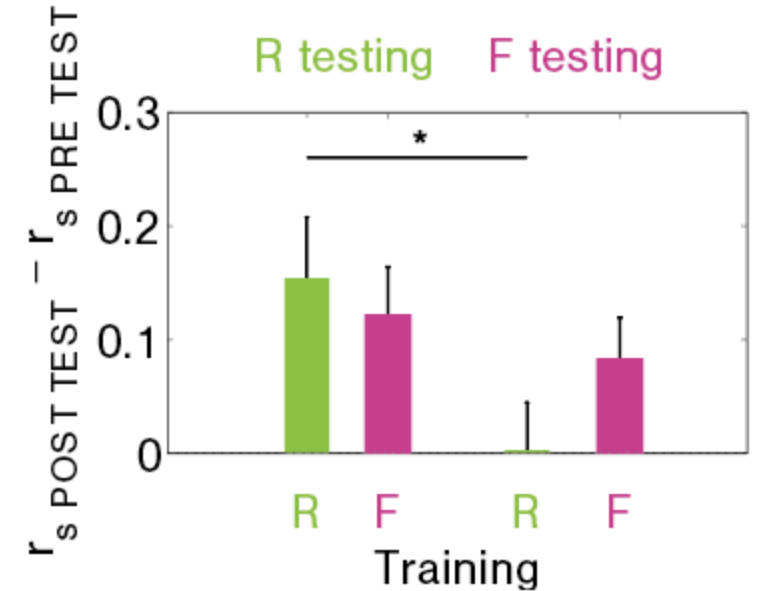

Results

Legend:

Rinit
— ROVED-FIXED
— FIXED-ROVED

1. People improve after R and F training.
2. Initial testing condition (Rinit, Finit) influenced performance.

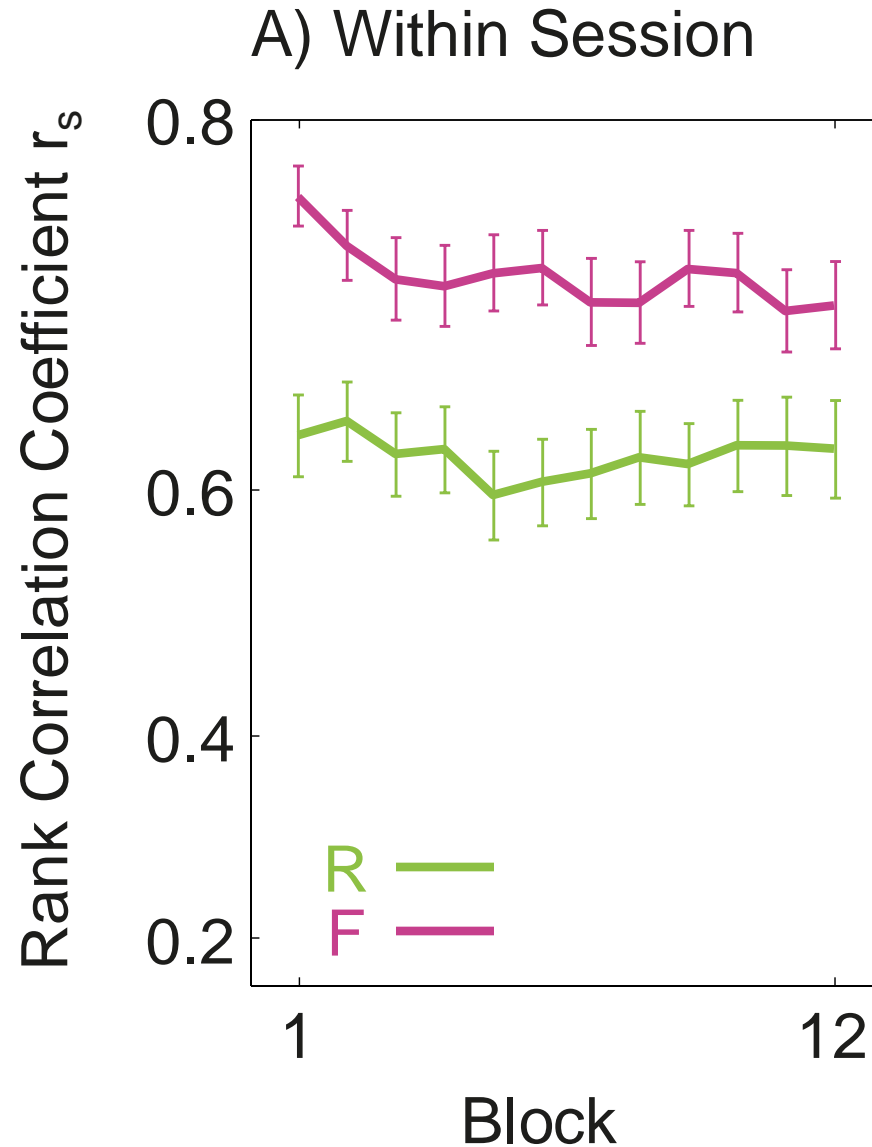

3. Learning transferred only after FIXED training.

Results

A) WITHIN
F decreases
slightly and R
stays constant.

B) BETWEEN
F increases
between
training, R
increases only
at testing block

Discussion

Training on R and F produced comparable improvement in the trained condition, but only the F training also generalized to untrained condition.

Testing performance was influenced by initial exposure during testing. Rinit performed worse in pretest than Finit but improved during at midtest (Day 4).

F training improved between sessions.

For R training, the effect was observed only at transitions between testing and training, suggesting that it was more the interleaved F runs during the tests that caused the improvement than the R training.

We are looking at the correlation of responding with the rove level and the initial performance during the testing blocks.
